

MANVEER SINGH

Lead Mobile Engineer | Flutter, iOS & Android

Berlin, Germany (relocating) | manveer9915@gmail.com | +91 99152 01749 | linkedin.com/in/manveer-singh-72b168130 | manveer1999.github.io

Work authorisation: EU Blue Card eligible, with the paperwork already done. B.Tech listed in anabin (institution DAV University, status H+; degree rated "corresponds"), so no individual credential assessment is required. Every document on my side is already gathered, so nothing is outstanding but the offer. Relocating to Germany. **Earliest start: about three months from a signed contract** — I am employed and serve 60 days' notice, and the binding constraint is the Blue Card appointment queue at the German mission in India, which runs alongside it. Happy to work with your legal team on the accelerated skilled-worker procedure (§81a AufenthG).

PROFILE

Six years in mobile, the last four leading Flutter on a production CRM app used daily by field teams across the US. I go deep where it matters: iOS memory and storage behaviour, Dart isolates, platform channels, code signing and staged rollout. I currently lead an eight-person cross-functional pod, so I bring the release discipline and the escalation handling as well as the code.

SELECTED IMPACT

- Root-caused and fixed an iOS storage failure consuming **97.94 GB** on a customer device against a 105.8 MB bundle. Four compounding defects, fixed with background isolates and a protected-file allow-list, shipped behind a kill switch, verified with a controlled two-device A/B.
- Traced a login crash with **no telemetry at all** to an image displayed at 800x800 but encoded at roughly 156 megapixels, where iOS overflowed memory before the crash-reporting SDK could initialise.
- Cut manual involvement in mobile CI/CD from roughly **1.5 hours to 10 minutes** per release.
- Owned **158 production releases** across mobile, web, public API and serverless, including code signing on both stores and Crashlytics-gated staged rollout with a defined halt rule.
- Delivered Android 16 targetSdk compliance by arguing against the available opt-out, then writing **44 test cases across seven sections** because the real work was QA, not the one-line bump.

EXPERIENCE

Logiciel Solutions | Ludhiana, India

Engineering team on a US SaaS platform for the construction and home-improvement industry

*Progression: joined as Senior Engineer Grade 4 (Mar 2022), promoted to Grade 5 (Mar 2024), appointed Engineering Lead (Nov 2024), promoted to **Grade 6** (Apr 2026). Three step-ups in four years.*

Engineering Lead (Senior Engineer, Grade 6) | Nov 2024 to Present

- Lead a cross-functional pod of eight across backend, frontend, mobile and QA, while remaining the deepest mobile engineer on the team.
- Run technical interviews for mobile roles and am the internal go-to for Flutter interview questions across teams.
- Own mobile release engineering end to end: FVM upgrades from 3.27.1 to 3.41.2 with CI parity, code signing on both platforms, obfuscation with retained symbols, staged rollout gated on Crashlytics, and a mobile monitoring window of three to four days rather than the one hour the org template assumed.

- Shipped an idempotent Claude Code setup skill into the Flutter repository (plus four others), and built an agent that investigates tickets, implements, writes tests and opens pull requests, stopping at human review. Mobile unit-test coverage moved from 17% to 21% on that branch.
- Argued the mobile case into org-wide standards: the release-plan template now accounts for mobile's multi-day monitoring window because I said so in review, and all of the critique was adopted into the published standard.
- Beyond mobile: designed a Google Cloud estate consolidation approved by the VP of Engineering, and root-caused a 12-hour platform-wide geocoding outage that had produced no alert.

Senior Software Engineer, Mobile (Grade 4, then Grade 5) | Mar 2022 to Nov 2024

- Led Flutter development on the flagship CRM app across iOS and Android, owning architecture, feature delivery, testing and store deployment.
- **Storage forensics:** an unbounded image cache with no eviction policy, base64 in-memory inflation of roughly a third, duplicated temp files never cleaned, and no storage visibility. Fixed with Flutter background isolates running cleanup on another core, a deletion allow-list protecting the crash log and local database, and cleanup piggybacked on the existing session-refresh cycle rather than a new timer. Measured a 20 to 40% reduction in image cache size on physical devices.
- Built a hidden triple-tap developer console with five categories of storage analytics, because iOS exposes none of this externally.
- Worked on Flutter-to-native bridge consistency and idempotency keys, and on Dart isolate suspension behaviour in release builds.
- De facto mobile release owner from March 2024, eight months before holding the title.
- Contributed to performance-critical features including real-time chat, Stripe integration and video calling. Maintain the sms_mms Flutter package.

Code Infosys | Surat, India

Associate Flutter Developer | Oct 2021 to Mar 2022

Junior Flutter Developer | Oct 2020 to Oct 2021

- Started in **native Android development and app publishing**, then moved to Flutter as the team's cross-platform bet.
- Shipped six products in eighteen months across health-tech, fitness and food delivery: video calling, Stripe and Braintree payments, live location tracking, real-time chat and local databases.
- Client-facing from the Associate grade onward: engaged directly with clients to resolve issues, ran R&D to keep the stack current, and wrote technical blogs.

NetMatics4u | Flutter Tutor | Jun 2020 to Oct 2020

HeyFlutter.com | YouTube Community Manager | 2020 to Present (part time)

- Instructed and mentored **more than 40 students** in Flutter, guiding them through real summer projects rather than exercises.
- Run the HeyFlutter.com YouTube community: developer questions at volume, moderation and technical engagement.

TECHNICAL

Mobile: Flutter, Dart, isolates, platform channels, FVM, method channels, Firebase, Crashlytics, LaunchDarkly, code signing (App Store and Play), staged rollout, obfuscation with retained symbols, Android targetSdk compliance, iOS memory and storage profiling

Testing: Unit and integration testing, widget tests, CI test parity, QA test-case authoring

Backend and platform, worked AI-first (I read, direct, review and own the outcome; I do not claim independent senior fluency): PHP with Laravel, Node, TypeScript, MySQL, Google Cloud, AWS Lambda, Terraform

Frontend, worked AI-first: React, AngularJS, Module Federation, micro-frontend decomposition (the decomposition design is mine; the component code is not where my depth is)

AI engineering: Claude Code skills and agents, MCP, agent-authored pull requests with human review gates

Practice: Release engineering, progressive delivery, incident RCA, code review, mentoring, Agile

SELECTED APPS

Leap CRM | End-to-end field and office CRM for the construction and home-improvement industry (iOS and Android)

Rent Zeme | End-to-end real estate and construction application

Doctor Finder | Appointment booking with live video and location tracking

Easy Home Workout | Fitness app with voice guidance and reminders

RECOGNITION

EDUCATION AND CERTIFICATION

B.Tech, Computer Science Engineering | DAV University, Jalandhar | 2017 to 2021 | **CGPA 9.4**

anabin: institution status H+, degree rated "corresponds" to a German Bachelor

Claude Certified Architect, Foundations | 934 / 1000 | May 2026

Open source: pub.dev/packages/sms_mms, a Flutter package I wrote and maintain on pub.dev.
