My agents write the code now.

So what am I supposed to do?

```
✓ agent-1   feature    tests green
● agent-2   tests      writing 14/16
● agent-3   debug      bisecting...
● agent-4   review     reading diff

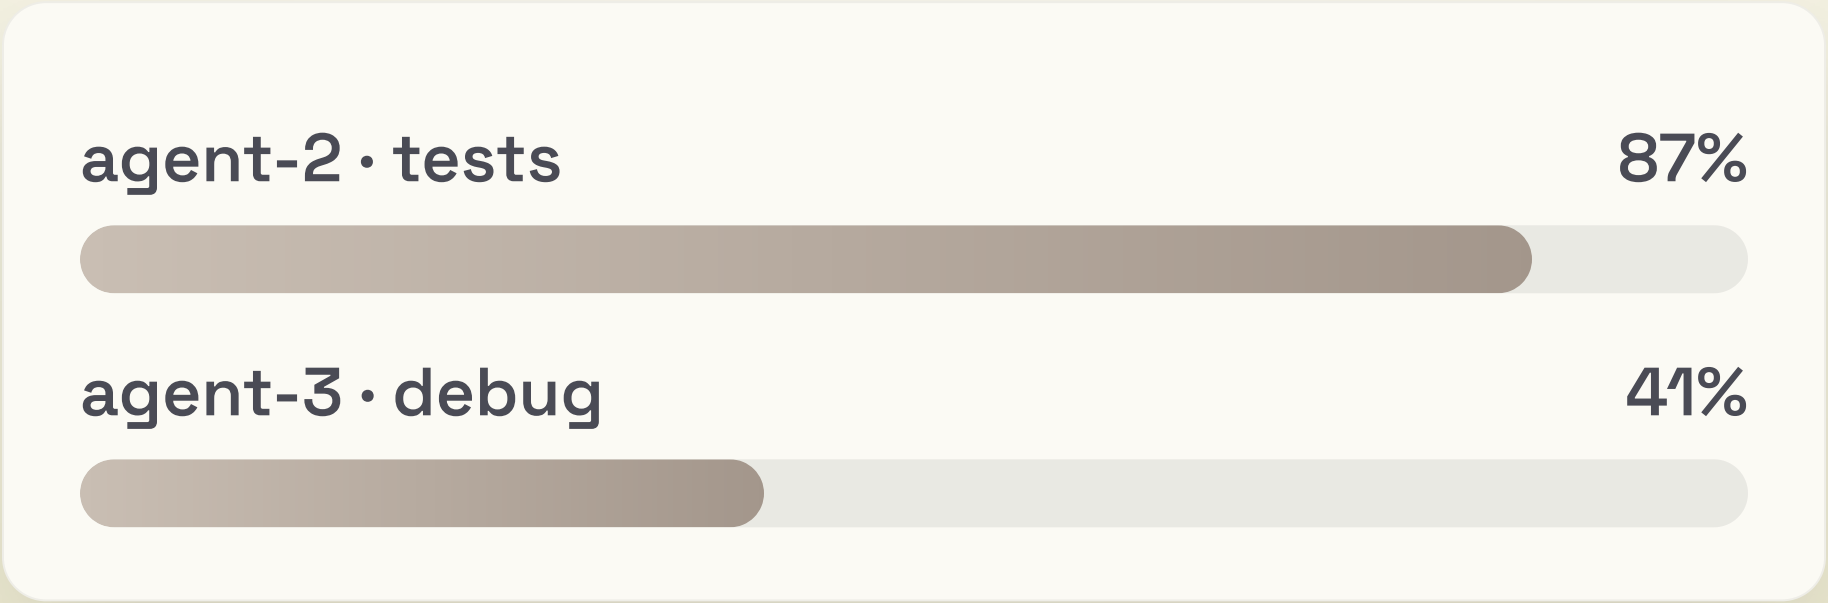

you >
```

Watch them. Wrong.

Watching an agent is the
progress bar of 2026.
It feels like work. **It isn’t.**

The work didn’t vanish. It moved.

CHEAP NOW

~~Writing the code~~

~~Tests, debugging, first review~~

EXPENSIVE NOW

Knowing what’s worth building

Knowing it’s right, and that it worked

Feed the queue.

While one batch runs, write
the next task. Properly.

```
## Task: one sentence, the outcome

Context it can't know:
why it exists, what we tried

Done means:
behaviour you can test

It will miss:
the edge case from last time
```

Build the harness.

Fix the task, or fix every future task.

Rule

A request. It usually listens.

Test

A fact. It can’t call itself done until it passes.

Gate

A guarantee. It stops at review and can’t merge.

Go to the customer.

~~Can we build it?~~

Should we?

Did it change anything?

When a feature takes an afternoon,
the build stops being the hard part.

We automated the part of the job everyone could see.

And kept the part nobody could.

My open question: is watching real oversight I'm underrating?

What do you do while your agents run?
